9.5 - Rotation of Conics/General Form of Conics

Classifying a conic if if the conic is not rotated

The graph of $Ax^2 + Cy^2 + Dx + Ey + F = 0$ is one of the following:

- Circle A = C, A≠0
 Parabola AC = 0, A=0 or C=0 but not both
- 3. Ellipse AC > 0, A and C have like signs
- 4. Hyperbola AC < 0, A and C have unlike signs

Ex. 1 - Classify the following conic sections by examining their general equations:

a.
$$4x^2 - 9x + y - 5 = 0$$

b.
$$4x^2 - y^2 + 8x - 6y + 4 = 0$$

c.
$$2x^2 + 4y^2 - 4x + 12y = 0$$

d.
$$2x^2 + 2y^2 - 8x + 12y + 2 = 0$$

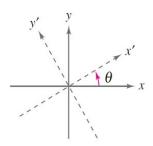

The General form of an equation of a conic with an axes parallel to either the x or y axis:

$$Ax^2 + Cy^2 + Dx + Ey + F = 0.$$

The General form of an equation of a conic whose axes are rotated so that they are not parallel to either the x-axis or the y-axis. The general equation for such conics contains an xy-term.

$$Ax^2 + \underline{Bxy} + Cy^2 + Dx + Ey + F = 0.$$

To eliminate this xy-term, you can use a procedure called **rotation of axes**. The objective is to rotate the x- and y-axes until they are parallel to the axes of the conic. The rotated axes are denoted as the x' axis and the y' axis

After the rotation, the equation of the conic in the new x ' y ' - plane will have the form:

$$A'(x')^2 + C'(y')^2 + D'x' + E'y' + F' = 0.$$

Because this equation has no *xy*- term, *you can* <u>obtain a standard form by completing the square</u>.

Rotation of Axes to Eliminate an xy-Term

The general second-degree equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

can be rewritten as

$$A'(x')^{2} + C'(y')^{2} + D'x' + E'y' + F' = 0$$

by rotating the coordinate axes through an angle θ , where

$$\cot 2\theta = \frac{A-C}{B}.$$

The coefficients of the new equation are obtained by making the substitutions

$$x = x' \cos \theta - y' \sin \theta$$
 and $y = x' \sin \theta + y' \cos \theta$.

- When trying to find θ (the angle that the x and y axes are rotated through), there are 2 possibilities to consider:
 - 1. If cot $(2\theta) = 0$, then $2\theta = \pi/2$, which means $\theta = \pi/4$
 - 2. If $\cot (2\theta) > 0$, then $0^{\circ} < 2\theta < 90^{\circ}$, so $0^{\circ} < \theta < 45^{\circ}$
 - 3. If $\cot (2\theta) < 0$, then $90^{\circ} < 2\theta < 180^{\circ}$, so $45^{\circ} < \theta < 90^{\circ}$
- **arccot 20 has a similar range as arccos 20 , which is $0^{\circ} < \theta < 180^{\circ}$ (Quad 1 If cot (20) > 0, Quad 2 If cot (20) < 0)
- ** If cot $(2\theta) \neq 0$, first find cos (2θ) . Then use the inverse cosine function key to obtain the value of 2θ , where $0^{\circ} < 2\theta < 180^{\circ}$. Finally, divide by 2 to obtain the correct angle θ .

Ex.2 - Solve for θ , when $0^{\circ} \le \theta < 360^{\circ}$

1.
$$\cot(2\theta) = 1$$

2. $\cot(2\theta) = \sqrt{3}$

2	aat (20)	\ _ 3/		
J.	cot (20)) – –74		

4.
$$\cot(2\theta) = -7/24$$

Ex.3 - Determine the appropriate rotation formulas to use so that the new equation contains no xy-term.

$$x^2$$
 - 4xy + y^2 - 3 = 0

1.
$$1\cot{(2\theta)}=\frac{A-C}{B}=\frac{1-1}{-4}=0$$
, if $\cot{(2\theta)}=0$, then $2\theta=\pi/2$, thus $\theta=\pi/4$

2.
$$x = x' \cos\theta - y' \sin\theta$$
 and $y = x' \sin\theta + y' \cos\theta$
 $x = x' \cos(\pi/4) - y' \sin(\pi/4) = x' \frac{\sqrt{2}}{2} - y' \frac{\sqrt{2}}{2} = \frac{\sqrt{2}}{2} (x' - y')$
 $y = x' \sin(\pi/4) + y' \cos(\pi/4) = x' \frac{\sqrt{2}}{2} + y' \frac{\sqrt{2}}{2} = \frac{\sqrt{2}}{2} (x' + y')$

A.
$$11x^2 + 10\sqrt{3}xy + y^2 - 4 = 0$$

B.
$$x^2 + 4xy + 4y^2 + 5\sqrt{5}y + 5 = 0$$

C.
$$34x^2 - 24xy + 41y^2 - 25 = 0$$

Ex.4 - Rotate the axes so that the new equation contains no xy-term. Discuss and graph the new equation by hand.

$$x^2$$
 - 4xy + y^2 - 3 = 0

1. cot (20) =
$$\frac{A-C}{B}$$
 = $\frac{1-1}{-4}$ = 0 , if cot (20) = 0 , then 20 = $\pi/2$, thus $\theta = \pi/4$

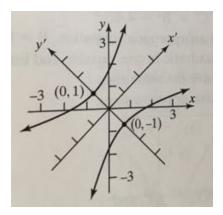

2.
$$x = x' \cos\theta - y' \sin\theta$$
 and $y = x' \sin\theta + y' \cos\theta$
 $x = x' \cos(\pi/4) - y' \sin(\pi/4) = x' \frac{\sqrt{2}}{2} - y' \frac{\sqrt{2}}{2} = \frac{\sqrt{2}}{2} (x' - y')$
 $y = x' \sin(\pi/4) + y' \cos(\pi/4) = x' \frac{\sqrt{2}}{2} + y' \frac{\sqrt{2}}{2} = \frac{\sqrt{2}}{2} (x' + y')$

3. Substitute these expressions in for x and y of the original equation

$$\left[\frac{\sqrt{2}}{2}(x'-y')\right]^{2} - 4\left[\frac{\sqrt{2}}{2}(x'-y')\right]\left[\frac{\sqrt{2}}{2}(x'+y')\right] + \left[\frac{\sqrt{2}}{2}(x'+y')\right]^{2} = 3$$

$$\frac{(y')^{2}}{1} - \frac{(x')^{2}}{3} = 1$$

4. This equation yields a hyperbola with a center at (0,0), a TVA axis parallel to the Y'-axis, vertices at (0,1) and (0,-1) on the y' axis. (because a=1). The graph on the x'y' - axis is then rotated $\pi/4$ units

A.
$$11x^2 + 10\sqrt{3}xy + y^2 - 4 = 0$$

B.
$$x^2 + 4xy + 4y^2 + 5\sqrt{5}y + 5 = 0$$

C.
$$34x^2 - 24xy + 41y^2 - 25 = 0$$

- Identifying conics without a rotation of axes

The equation $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$ defines:

- a. A parabola if B^2 4AC = 0
- b. An ellipse if B^2 4AC < 0
- c. A hyperbola if B^2 4AC > 0
- Ex.5 Identify each equation without applying a rotation of axes.

A.
$$2x^2 - 3xy + 4y^2 + 2x + 3y - 5 = 0$$

Since $B^2 - 4AC = (-3)^2 - 4(2)(4) = -23 < 0$, thus this conic is an ellipse since A \neq C

B.
$$10x^2 + 12xy + 4y^2 - x - y + 10 = 0$$

C.
$$4x^2 + 12xy + 9y^2 - x - y = 0$$

D. $3x^2 + 2xy + y^2 + 4x - 2y + 10 = 0$
