

# \*Chapter 13

Gas Laws

## \*The Nature of Gases: Physical Properties of gases:

- \*Gases have mass: an empty basketball weighs less than a full one
- \*It is easy to compress gas: This is why it is used in air bags and shock absorbers
- \*Gases fill their container completely: Balloons get bigger when you blow them up

## \* 13-1 A Model to Explain Gas Behavior

\* Gases can move through each other rapidly and this is known as diffusion. (Explains smells traveling through the air)

\* Gases exert pressure: explains why balloons keep their shape

\* **Model of gases**  
(continued)

\* Gas properties are explained by the *Kinetic Molecular Model* that describes the behavior of the particles that make up a gas.

# \* Kinetic Molecular Theory

- \* all gas consists of small particles, each which has a mass.
- \* the particles spread apart by relatively large distances.
- \* the particles are in constant, rapid, random motion.
- \* Gases exert pressure because their particles frequently collide with the walls of the container in perfectly elastic collisions. (no energy of motion is lost)

# \* Kinetic Molecular Theory

- \* The kinetic energy of gas particles depends on the temp of the gas.
- \* Gas particles exert no attractive forces on one another.

# \* Kinetic Molecular Theory

- \* To study a gas sample and make predictions about its behavior under changed conditions, it is important to be familiar with four measurable variables:
  - \*  $n$  = amount of gas (measured in g or moles)
  - \*  $V$  = volume (measured in mL, L etc.)
  - \*  $T$  = temperature (measured in  $^{\circ}\text{C}$  but converted to K by  $^{\circ}\text{C} + 273 = \text{K}$ )
  - \*  $P$  = pressure ...

## \* 13-2 Measuring Gases

- \* Why doesn't a balloon burst or deflate?
  - \* Because the gas in the balloon is pushing on the inside and the atmosphere is pushing on the outside of the balloon
- \* Gas pressure - determined by units of force per unit area
  - \* SI unit of pressure = pascal (Pa)
  - \* Other pressure units include atmospheres (atm), Torricellis (torr), and mm Hg
  - \*  $1 \text{ atm} = 101.3 \text{ kPa} = 760 \text{ torr} = 760 \text{ mmHg}$  Standard pressures

\* Pressure (P)

- \* Atmospheric pressure - pressure of air due to the pull of gravity on gas particles (because they have mass)
- \* Measured with a barometer
  - \* U shaped glass tube upside down in pool of mercury. The height of the mercury tells you how much pressure is being exerted on the open reservoir of mercury.

# \* Atmospheric pressure

\*Manometer - used to measure the pressure of a gas in a closed container.

\*Manometer

\* The gas inside a basketball pushes the mercury in a manometer to a height that is 15 mm higher on the closed side. The atmospheric pressure is measured at 750 mmHg.

1<sup>st</sup> the pressure inside the basketball is LOWER than the atmospheric pressure

2<sup>nd</sup> because the pressure is LOWER subtract the height of the gas side from the atmospheric pressure

$$750 - 15 = 735 \text{ mmHg}$$

3<sup>rd</sup> convert to atm

$$735 \text{ mmHg} \times \frac{1 \text{ atm}}{760 \text{ mmHg}} = 0.97 \text{ atm}$$

## \* Manometer problems

\*WS 13-2 PP do #10 - 15

\*Try some more...

# \* 13-3 The Gas Laws

\* **Boyle's Law** - The pressure and volume of a sample of gas at constant temperature are inversely proportional to each other or

$$P_1 V_1 = P_2 V_2$$

Ex. WS13-3 PP #1

\* **Charles's Law** - At constant pressure, the volume of a constant amount of gas is directly proportional to its Kelvin temperature.

$$V_1 T_2 = V_2 T_1 \text{ or } \frac{V_1}{T_1} = \frac{V_2}{T_2}$$

\* Ex. WS13-3 PP #6

\* **Charles Law**

\* **Guy Lusaac's Law** - at a constant volume and a fixed amount of gas the pressure and Kelvin temperature of a gas will be directly related.

$$P_1 T_2 = P_2 T_1 \text{ or } \frac{P_1}{T_1} = \frac{P_2}{T_2}$$

\* **Guy-Lusaac's Law**

\*Ex. If an aerosol can with a pressure of 1 atm and a temperature of 25 °C is thrown into a fire and the pressure increases to 2.5 atm. What is the temperature of the gas at this pressure?

$$T_1 = 25 \text{ }^\circ\text{C} + 273 = 298 \text{ K}$$

$$T_2 = X$$

$$P_1 = 1 \text{ atm}$$

$$P_2 = 2.5 \text{ atm}$$

$$T_2 = \frac{P_2 T_1}{P_1}$$

$$T_2 = \frac{(2.5 \text{ atm})(298\text{K})}{1 \text{ atm}}$$

$$T_2 = 745 \text{ K or } 472 \text{ }^\circ\text{C}$$

- \* A gas measures 25.0 mL at 735 mmHg, what will its volume be at 750 mmHg?
- \* Answer: 24.5 mL
  
- \* A 50.0 mL volume of gas is measured at 20 °C. What will the volume of the gas be at 40 °C?
- \* Answer 53.4 mL
  
- \* A flask containing hydrogen gas has a pressure of 22.5 kPa and a temperature of 25 °C. What will the pressure be if the gas is heated to 38 °C?
- \* Answer: 23.5 kPa

## \* Examples

\*When all but amount of gas changes, the three changing variables are related in the same ways as in Boyle's, Charles', and Guy-Lusaac's laws...so they are *combined* to be the **combined gas law**...

$$P_1 V_1 T_2 = P_2 V_2 T_1 \text{ or } \frac{P_1 V_1}{T_1} = \frac{P_2 V_2}{T_2}$$

## \*Combined Gas Law

\*WS13-4 #2

\* $V_1 =$

$V_2 =$

\* $T_1 =$

$T_2 =$

\* $P_1 =$

$P_2 =$

\***Example**

- \* Avogadro's Law - equal volumes of gases at the same temperature and pressure contain an equal number of particles
- \* Important points
  - \* All gases show the same physical behavior
  - \* A gas with a larger volume consist of a greater number of particles.
  - \* The volume of one mole of a gas is called the **molar volume** (@ STP...standard temperature and pressure)...22.4 L

## \* Avogadro's Law: The Amount-Volume Relationship

\* The sum of the partial pressures of all the gases in a gas mixture is equal to the total pressure of the gas mixture.

\*  $P_T = p_a + p_b + p_c + \dots$

\*  $P_T$  is the total pressure

\* Dalton's Law of Partial Pressures

\*Ex. What is the atmospheric pressure if the partial pressure of N<sub>2</sub>, O<sub>2</sub>, and Ar are 604.5mmHg, 162.8 mmHg, and 0.5 mmHg

$$P_T = 604.5 \text{ mmHg} + 162.8 \text{ mmHg} + 0.5 \text{ mmHg}$$

$$P_T = 767.8 \text{ mm Hg}$$

\*Example

- \* The ideal gas equation describes the physical behavior of an ideal gas in terms of the pressure, volume, temperature, and the number of moles of a gas.
- \* Ideal gas - a gas that is described by the kinetic-molecular theory
- \* Real Gas - behave like ideal gases except at low temperatures and high pressures.

## \* 13-4 The Ideal Gas Law

\*This is a summary of the gas laws from the previous section.

\* $PV = nRT$

P= gas pressure (must match R)

V = gas volume (must be in L)

n= the number of **moles** of gas

R = ideal gas constant (must match P)

T = temperature of a gas (must be in K)

## \*The Ideal Gas Equation

\*Ex. How many moles of a gas at 100°C does it take to fill a 1.00-L flask o a pressure of 1.50 atm?

$$PV = nRT$$

$$n = \frac{PV}{RT}$$

$$n = \frac{(1.5\text{atm})(1.00\text{L})}{(0.0821\text{atm}\cdot\text{L}/\text{Mol}\cdot\text{K})(373\text{K})} = 0.0490 \text{ mol}$$

\*Example
